

**National Interagency Coordination Center
Incident Management Situation Report
Monday, December 29, 2014 – 0800 MT
National Preparedness Level 1**

National Fire Activity (Dec. 19 – Dec. 28)

Initial attack activity: Light (97 new fires)
 New large fires: 1(*)
 Large fires contained: 0
 Uncontained large fires: ** 1
 Area Command Teams committed: 0
 NIMOs committed: 0
 Type 1 IMTs committed: 0
 Type 2 IMTs committed: 0

** Uncontained large fires include only fires being managed under a full suppression strategy.

[Link](#) to Geographic Area daily reports.

Southwest Area (PL 1)

New fires: 5
 New large fires: 1
 Uncontained large fires: 1

* **Walker**, Colorado River District, BLM. Started on Bureau of Reclamation land 15 miles north of Yuma, AZ. Chaparral. Smoldering.

Predictive Services Discussion: Cold, Canadian air will sag southward from the northern Plains through the mid-west before spreading into the western U.S. with temperatures and snow levels well below normal for this time of the season. Wintery weather will result from California through the Desert Southwest as well as the Great Basin and northern Rockies as a series of upper level disturbances take advantage of the cold air entrenched over the region through mid-week. As the New Year approaches late this week, high pressure will lock in Arctic air and frigid temperatures over the much of the country. East of the Rockies, precipitation will be enhanced along a frontal boundary stretching from the Gulf Coast northeastward through the Mid-Atlantic.

Hazard Trees – Situational Awareness

Felling Safety Category

Snags (dead, standing trees without leaves or needles in the crowns) and green hazard trees present a significant threat to wildland firefighter safety. Snags typically have much lower fuel moistures than live, green trees; and they burn more readily. In the process, they often throw off embers creating spot fires in advance of the main fire. Snags may burn through more quickly than green trees and can fall without warning. Live, green trees weakened by insects, disease, weather, fire, and age presents another hazard and they can also fall without notice.

- The risk of serious injuries from hazard trees may increase during the night operational period when visibility is reduced.
- While work in cooler, nighttime environments can help control efforts, it also presents an increased risk from unseen falling snags and weakened live trees. Night operations should be restricted in areas of high risk rated dead and dying trees.
- Environmental conditions that increase risk from hazard trees: Strong or gusty winds from storm cells. Air operations - water or retardant drops, rotor wash from helicopters. Steep slopes with rolling material. Erosion and undercut root systems. Diseased or bug-killed areas (Mountain Pine Beetle).
- Things to consider when assessing the potential dangers of hazard trees: Trees have been burning for an extended period. High-risk tree species (those that are known for rot and shallow root systems) in the area. Numerous downed trees/material. Broken tops and dead limbs overhead. Accumulation of downed limbs, tree decay, cavities, splits, cracks, lack of needles, bark, limbs or other indicators of overhead hazards. Roots damaged by equipment, fire or erosion create hazards.
- Mitigation measures to take: Identify and establish No-Work-Zones (NWZ) in all high-risk areas until the hazard has been mitigated. Instruct firefighters of established NWZ in briefings. Identify with flagging/signs, and show area on maps. Establish lookouts to protect NWZs. Assign only qualified sawyers and Falling Bosses. Order additional professional fallers in advance. Use heavy equipment, and blasters when appropriate. Plan a quick and safe escape routes. Do not turn your back on a falling tree or known hazard. Use lookouts to maintain secure felling areas. Maintain situational awareness.
